

Day 18 - React

~Front End Frameworks

Before Front End Frameworks the way to make a dynamic website was to write the logic on the backend, with the DOM.

Using DOM API's:

- document.createElement
- document.appendChild
- document.setAttribute
- document.children

There was no **central state**

React write the DOM for the user, and you just have to call the function and give it a repetition count.

A function which takes the current state as the input and renders it to React.

STATE + LOGIC \Rightarrow React
